Description

- Provide higher load currents for concurrent power tests
- Discharging process controlled by a TOR KEL unit
- Connect directly to the battery under test

The TXL series are extra load units for the TOR KEL battery test systems. They are designed to provide higher load currents for use in constant current or constant power tests. Together, TOR KEL and the TXL extra loads form a system that can discharge batteries with currents of up to several kA. The TXL extra loads are connected directly to the battery, and TOR KEL measures the total current using a clamp-on ammeter.

There are five extra loads available: TXL830, TXL850, TXL865, TXL870, and TXL890. The details for these can be found in the TOR KEL data sheet.
